pharmapath™
Pharmapath helps physicians and patients cope with managed pharmaceutical care and secure reimbursement for pharmaceutical and biotechnology products. Using this site and related intranets, providers can document medical necessity, appeal coverage denials, and order drugs online. Pharmapath's mission is to use Internet technologies to restore physician prescribing authority and improve patient access to leading-edge therapies.

Glucophage® (metformin hydrochloride tablets)
Reimbursement information for patients and their families
Glucophage is a drug that treats non-insulin dependent or "type 2" diabetes, the most common form of diabetes.
If you have type 2 diabetes, your body either does not make enough insulin to turn your blood sugar into energy your muscles can use - or it does not respond normally to the insulin your body does make. In either case, your blood sugar, in the form of glucose, will build up in your blood. If a build-up of glucose goes untreated over time, it can lead to serious complications, including kidney damage, nerve damage in your limbs, and blindness. Diabetes is also associated with a greater incidence of heart disease and problem pregnancies than non-diabetics.
The main goal of treating type 2 diabetes is to lower your blood glucose to a normal or a near normal level. In many cases, changing your diet alone may be enough to control type 2 diabetes. But often, medications for managing type 2 diabetes are needed, along with your recommended diet and exercise plan.
Health plans often require documentation of your specific medical needs for Glucophage.
Click here to download a letter from your doctor to your health plan.
Contact Bristol-Myers Squibb's reimbursement assistance program at (800) 736-0003
For more information on type 2 diabetes, contact Bristol-Myers Squibb's Diabetes Center at (800) 392-9700

Fig. 5B

500

Glucophage works to lower the amount of glucose in your blood by helping your body respond better to the insulin your body is already producing, decreases sugar production in the liver and decreases intestinal absorption of sugar. Instead of producing more insulin, Glucophage rarely causes hypoglycemia, when used alone and as prescribed, or low blood sugar, and it usually does not cause weight gain.

522

Important Information.

The most serious side effect associated with Glucophage (metformin hydrochloride tablets) is called lactic acidosis, which is rare and has occurred in one in 33,000 patients on Glucophage over the course of one year. If lactic acidosis occurs, it can be fatal in up to half the cases. You should not take Glucophage if you have kidney disease or dysfunction, if you are 80 or older (unless you have first had your kidneys tested), if you are taking medication for congestive heart failure, if you have a history of liver disease, or if you drink alcohol excessively. The most common side effects are minor ones such as diarrhea, nausea, and upset stomach, which usually occur during the first few weeks on Glucophage.

IMPORTANT SAFETY INFORMATION ABOUT GLUCOPHAGE AND GLUCOVANCE

Glucophage and Glucovance are not for everyone. In rare cases, Glucophage or Glucovance may cause lactic acidosis. If it occurs it can be fatal in up to half of the cases. Lactic acidosis occurs mainly in people whose kidneys are not functioning properly. You should not take these drugs if: you have kidney problems, are 80 or older (unless you have your kidneys tested first), are taking medication for heart failure, are seriously dehydrated, have a severe infection, have a history of liver disease or drink alcohol excessively.

The most common side effects are diarrhea, nausea, and upset stomach. Symptoms of hypoglycemia (low blood sugar), such as lightheadedness, dizziness, shakiness, or hunger may occur.

MEDWATCH, 1-800-332-1088, is available to report any serious adverse events for any drug.

Your use of the information on this site is subject to the terms and conditions of our Legal Policy.

Re:
[PATIENT NAME] 718
[DATE OF BIRTH] 720
[PATIENT'S SUBSCRIBER NUMBER] 722
[POLICY ID/GROUP NUMBER] 724

730

Greetings:

In support of reimbursement for Glucophage® (metformin hydrochloride tablets) for [PATIENT NAME], our clinical examination combined with the patient's history indicate that this patient has type 2, (non-insulin dependent) diabetes
(ICD-9-CM code 250.2), and that our first-line approach to managing this condition with diet and exercise is not
sufficient to control the blood sugar in this patient.

Our examination and history further indicate that this patient is an ideal candidate for Glucophage.

PICK THE PARAGRAPH FROM THE FOLLOWING THAT APPLIES...

742

- The patient's blood sugar levels are not adequately controlled with diet and exercise, and requires drug therapy
as part of their management plan.

740

744

-The patient is obese and metformin therapy is usually not associated with weight gain.

750

It is my clinical judgment that treatment with metformin is indicated for this patient. I further believe that a failure
to reimburse for this drug is to deny this patient access to the standard of care to which he/she is contractually entitled
as a member of your health plan.

If you require further documentation regarding this matter, please feel free to contact me at my office.

Sincerely,

752

[PRESCRIBING PHYSICIAN]
[PROVIDER NUMBER]
